

Industrial Wastewater Pretreatment Facility

Through experience over many years of waste handling projects, Hydro-Klean has identified a need for an industrial wastewater pretreatment facility to handle disposal of non-hazardous waste streams resulting from regular manufacturing processes, industrial cleaning and emergency response cleanup activities. As a solution, Hydro-Klean now operates its own industrial wastewater pretreatment facility.

Industrial Wastewater Pretreatment Facility

Our Industrial Wastewater Pretreatment Facility allows us to discharge water to the sanitary sewer, recycle petroleum products and stabilize sludge for disposal at the local landfill. It accepts materials that are not suitable for direct discharge to the sanitary sewer due to high oils and/or metals content.

The City of Des Moines Wastewater Reclamation Authority permits our facility, and it operates under the Centralized Waste Treatment regulations of 40 CFR 403, which allow for the pretreatment of waste materials generated at off-site locations. Many typical waste streams are from oil/water separators, wash bay pits, metal preparation systems, petroleum releases, machine coolant/cutting liquids and water based parts washers. Hydro-Klean's fleet of powerful vacuum trucks can collect the waste at your facility and deliver it to the Hydro-Klean facility for disposal. The Pretreatment Facility completes the loop when you request service from the initial call through disposal.
